Goran Mržljak

Senior software developer

Zagreb, Croatia · +385 91 224 3145 · goran.mrzljak@gmail.com

Profile

I build software and make complex codebases easier to work with. I have 18 years of professional experience, including 10 years of independent contract work.

Recently, I've worked mainly with React, TypeScript, and Node.js. I build frontend and backend applications from scratch through to production, and redesign and restructure existing systems. I favor clear architecture and readable code that is easy to maintain and extend.

My experience also includes desktop and mobile applications.

I work independently or within established teams. I design application architecture, help clarify requirements, mentor and onboard developers, and conduct developer interviews.

I now build software by directing AI coding agents, mainly Claude Code, through a system of reusable skills and rules that I maintain. I still own the architecture and decide whether the result is good enough.

> I'm looking for hands-on senior development work: frontend, backend, or full-stack.
>
> B2B contracts: full-time, part-time, or fixed-price. Remote, with hybrid work possible in Zagreb, Croatia.

Work experience

Selected projects are shown below. See the detailed CV for the full project history.

Freelance Software Developer / Self-Employed

January 2016 – Present

Primarily Full-Stack Web Developer — Remote

HVAC monitoring and control web application

React · TypeScript · MobX · Tailwind CSS · FIN Framework · Copilot

I worked in an established team developing a web application for a large multinational to monitor and control HVAC equipment across buildings and sites. Using the platform's specialized technologies and tools, I built sections of the frontend, components, and controls to match UI designs and fixed bugs.

Warehouse robotics web application

Angular · TypeScript · RxJS

I joined an established warehouse automation project to resolve frontend issues and improve maintainability and developer experience. I independently migrated all four frontend variants from Angular 8 to 18. Each had more than 100,000 lines of code, although much of it was similar across variants. The migrations required resolving over a thousand errors per variant, adapting code to major dependency changes, and refactoring. I completed them without observed regressions, removing a major blocker for a security audit. Beyond the migration, my work included implementing substantial frontend features and subsystems based on client requirements, along with ongoing maintenance and bug fixes.

Oracle Eloqua to mobile messaging integration

React · TypeScript · NestJS · MySQL · Prisma · Jest · OAuth · JWT

I independently built an integration for sending SMS and WhatsApp messages within Oracle Eloqua marketing campaigns. I clarified requirements with the client, defined the architecture, and implemented the frontend, backend, database, and external API connections. The application coordinated asynchronous flows involving hundreds of thousands of messages. I resolved race conditions, implemented multiple authentication methods, and wrote extensive backend tests covering endpoints and complex message flows.

Mobile fueling management system

Node.js · Express · MongoDB · Angular · TypeScript · NgRx

I worked on the backend and Angular administration app of a production system for a leading mobile fueling company in California. I was responsible for backend subsystems and coordinated changes across the application. I wrote and ran migration scripts against the production MongoDB database without issues, improved testing practices, and interviewed, onboarded, and mentored developers.

Insurance web platform

React · TypeScript · Redux · RxJS · Material UI · Storybook · Jest

I restructured substantial parts of a roughly 100,000-line frontend for a UK insurance platform. For most of my time on the project, I was its sole frontend developer. While developing new features, I resolved many of the existing TypeScript issues, rebuilt state management and API handling, and reorganized parts of the frontend architecture. I also improved build tooling, introduced automated tests, and built a component library with Material UI and Storybook.

Graveyard management web application

Vue · TypeScript · Kotlin · Spring Boot · PostgreSQL · Jest

I built nearly the entire frontend and backend of a multi-tenant graveyard management application, including interactive maps, PDF reports, and database migrations. I wrote frontend unit tests and backend integration tests covering much of the application across all layers.

Other projects

TypeScript · React · React Native · Angular · Java · Spring Boot · PostgreSQL · C# · Ruby

I developed software for electricity consumption, accounting, parking payments, national single sign-on, government payment validation, telecom reporting, e-learning, and recruitment. My work ranged from mobile and web frontends to complete backends, integrations, and applications. I also built data export tools and resolved urgent issues before a production release.

I independently built a configurable Java component for government payment validation from a specification of about 180 pages, with extensive automated tests, in less than two weeks. I added all 100 QA scenarios to the regression suite and fixed the reported failures. No further issues were reported.

Earlier software development roles

January 2007 – May 2016

C# Software Developer

Croatia and remote

Web and desktop applications

C# · .NET · ASP.NET · WPF · Windows Forms · C++ · SQL

I developed web and desktop software for government services, financial institutions, nuclear inspection, fuel dispenser monitoring and control, spreadsheet processing, and 3D animation. I built complete applications and components, implemented substantial parts of larger systems, and maintained existing software. My work covered user interfaces, business logic, databases, reporting, and hardware integration.

Education

Faculty of Electrical Engineering and Computing (FER), University of Zagreb

Graduate Engineer of Computing. Five-year degree program, totaling 284 ECTS credits.

Skills

Selected skills are listed below. See the detailed CV for the full list.

Programming languages	TypeScript, JavaScript, HTML, CSS
Libraries and frameworks	React, Angular, Express, NestJS, Tailwind CSS, Class Variance Authority, Shadcn/UI, Material UI, Ant Design, Redux, redux-observable, MobX, React Hook Form, Zod, RxJS, NgRx
Platforms	Node.js, Bun
Tools	ESLint, Prettier, Vite, Webpack, Jest, Vitest, Storybook, Docker, Bash, npm, pnpm, Bun Package Manager
Databases	PostgreSQL, MySQL, MongoDB
CI/CD	GitHub Actions
Source control	Git, GitHub, GitLab, Bitbucket
IDEs	Visual Studio Code, WebStorm, IntelliJ IDEA
AI	Claude Code, Codex, Copilot
Operating systems	Windows, macOS, Linux

Personal information

Name	Goran Mržljak
Location	Zagreb, Croatia
Nationality	Croatian
Languages	Croatian - native · English - fluent
Driver's License	AM · B · F · G
